

# Causality and Research Design

POLI 205 Doing Research in Politics

Fall 2015

# Causal Theories

- The goal of political science (and all science) is to create and then evaluate causal theories
- Cause ( $X$ ) and effect ( $Y$ )
- Basis of causality
  - *Time Ordering*: The cause precedes the effect
  - *Co-Variation*: Changes in  $X$  are associated with changes in  $Y$
  - *Non-Spuriousness*: There is not a variable  $Z$  that causes both  $X$  and  $Y$

# Determinism and Probabilities

- **Deterministic:** If  $X$  then  $Y$  with certainty

$$Y_i = \alpha + \beta X_i$$

- **Probabilistic:** If  $X$  then  $Y$  with uncertainty

$$Y_i = \alpha + \beta X_i + \epsilon_i$$

## Multiple Causes

- Theories are *bivariate*,  $X$  causes  $Y$ , but reality is *multivariate*
- $X$  causes  $Y$  but some other variables,  $Z$ , might also (or instead) cause  $Y$
- If we don't control for  $Z$ , the other possible causes of  $Y$ , then our conclusions about whether  $X$  causes  $Y$  might very well be mistaken
- How do we control for  $Z$ ?
  - Research design

## Four Causal Hurdles

- Is there a credible *causal mechanism* that connects  $X$  to  $Y$ ?
- Can we rule out *reverse causation* the possibility that  $Y$  could cause  $X$ ?
- Is there *covariation* between  $X$  and  $Y$ ?
- Have we controlled for all *confounding variables*  $Z$  that might make the association between  $X$  and  $Y$  spurious?

# Causal Mechanism

- Answer the “how” and “why” questions
- What is the process or mechanism that, logically speaking, suggests that  $X$  might be a cause of  $Y$ ?
- What is it specifically about having more(less)  $X$  that causes more(less)  $Y$ ?

## Reverse Causation

- Endogeneity
- *A country's level of economic development causes it to be more or less democratic*
- *Variations in consumer confidence cause a president's approval rating to change*
- *Ethnic conflict causes civil wars.*

# Covariation

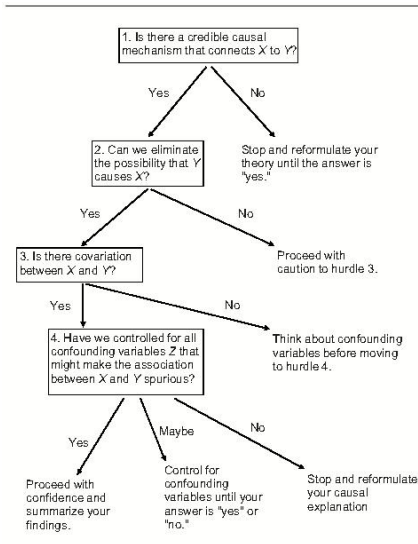

- Measured empirically
- *Correlation is not causation*, but it's normally a key component of causation

## Confounding Variables

- When one scholar is evaluating another's work, perhaps the most frequent objection is that the researcher "failed to control for" some potentially important cause of the dependent variable
- So long as a credible case can be made that some uncontrolled-for  $Z$  might be related to both  $X$  and  $Y$ , we cannot conclude with full confidence that  $X$  indeed causes  $Y$
- The importance of *research design*

# Causal Checklist

# Use of the Scientific Method

- Scientific method
- Scientific research:
  - The goal is *inference*
  - Procedures are public
  - Conclusions are uncertain
  - *Observe* and *explain*
  - Can be replicated

# Inference and Validity

- **Inference:** the process of using *what we know* to learn about *what we do not know*
  - What we do not know: is our theory correct?
  - What we do know: data
- Types of inference:
  - *Descriptive* inference: using observations (data) to learn about unobserved facts
  - *Causal* inference: using observations (data) to learn about causal effects

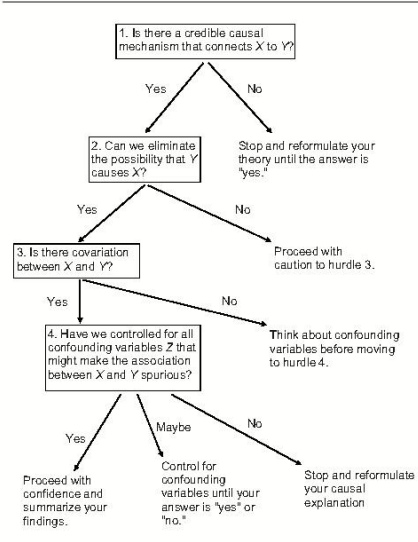

# Inference and Validity

- **Validity:** Are we making *valid* inferences about the relationship between  $X$  and  $Y$ ?
- Types of validity:
  - External
  - Internal

## Types of Validity

- **External validity:** Degree to which we can be confident that our results apply to *other contexts*
  - Are the results generalizable?
- **Internal validity:** Degree to which we can be confident that  $X$  causes  $Y$
- Threats to validity
  - What could reduce our confidence about our results?
  - Causal hurdles

# Causal Hurdles

# Other Threats to Validity

- Poor measures of variables
  - are the measures valid and reliable?
- Selection bias
  - is the sample representative?
- Setting
  - *Hawthorne* effect

# Inference

Following

Global warming isn't real because I was cold today! Also great news: World hunger is over because I just ate.

## So much for “drug-addict” welfare recipients...

In Tennessee, a new law  
requiring welfare applicants  
to be drug tested has turned  
up **only 1 positive test** in over  
800 applications.

**That's 0.12%.**

Source: The Tennessean

# Research Design

- **Research Design:** the plan to collect information to address your research question
  - Two types: *Experimental* and *Observational*
  - Four Components:
    - Research question
    - Theory
    - Data
    - Data analysis
- **Data:** pieces of information
  - Can be *qualitative* or *quantitative*

- Does  $X$  (treatment) cause  $Y$  (outcome)?
- Causal (treatment) effect:  $\tau_X = Y_1 - Y_0$
- $\tau_X$  : Treatment ( $X$ )
- $Y_1$  : Group that received treatment
- $Y_0$  : Group that *did not* receive treatment

# Experimental Design

- **Experiment:** is a research design in which the researcher both *controls* and *randomly assigns* values of the independent variable (treatment) to the subjects
- Causal (treatment) effect:  $\tau_X = Y_1 - Y_0$

# Experimental Design

- **Control:** the values of the independent variable that the subjects receive are not determined either by the subjects themselves, or by nature
- **Random Assignment:** All participants are equally likely to be in the *control* group as the *treatment* group
  - *Treatment* group: Group that receives treatment
  - *Control* group: Group that did not receive treatment
- Why is random assignment important for experimental designs?

# Observational

- **Observational:** is a research design in which the researcher does not have control over values of the independent variable, which occur naturally
  - Variation of  $X$  and  $Y$  important
- Causal (treatment) effect:  $\tau_X = Y_1 - Y_0$ 
  - more (less)  $X$  = more (less)  $Y$
  - statistical controls for  $Z$  variables
- *Large  $n$  either Cross-sectional or time-series, and case study*

## Large $n$ Cross-Sectional

- A *cross-sectional observational study* examines variation across a cross-section of individual spatial units
  - Same variable(s) across units
- Example: the connection between the preferences of the voters from a district ( $X$ ) and a representative's voting behavior ( $Y$ )

## Large $n$ Times-Series

- A *time-series observational study* examines variation within one spatial unit over time
  - Same variable(s) and same unit(s) over time
- Example: the connection between GDP growth and presidential approval from 1995-2005

# Longitudinal

- A *longitudinal observational study* examines variation across *spatial units over time*
  - *Panel data*: Same variable(s) across the same units and over time
  - *Times-series cross-sectional (TSCS)*: Same variable(s) across different units and over time
- Examples:
  - *Panel*: the connection between GDP growth of countries in the European Union and incumbent party support from 1995-2005
  - *TSCS*: the connection between ideology and concern about climate change from 1995-2005 using pooled surveys

# Case Study

- *Case Study*: Precise description of a single case ( $n=1$  or maybe a few)
  - *Exploratory*: little is known about a phenomenon
  - *Descriptive*: discover or describe what happened in a single or select few situations
  - *Explanatory*: answer how or why questions

# Case Study Approaches

- Controlled Comparison:
  - *Method of difference:*
    - One (or a few cases)  $Y=1$
    - One (or a few cases)  $Y=0$
    - $Z$  is the same across cases; what is different? ( $X$ )
  - *Method of agreement*
    - Two (or a few) cases  $Y=1$
    - What is similar across cases? ( $X$ )

## Case Study Approaches

- Congruence Procedures: congruence between values of  $X$  and  $Y$ 
  - *Type 1*: Compare to typical values
    - Are values of  $X$  higher or lower than average matched by higher or lower values of  $Y$ ?
    - Look for extreme values of  $X$  and  $Y$
  - *Type 2*: Multiple within-case comparisons
    - Does  $X$  and  $Y$  covary across a range of circumstances within the case?
    - Need multiple occurrences of  $X$  and  $Y$
    - Approaches a large- $n$  study as number of observations increase

# Case Study Approaches

- Process Tracing: Explores the chain of events through which  $X$  causes  $Y$

$$X \rightarrow p \rightarrow q \rightarrow r \rightarrow Y$$
